Honeywell

Meet SLATE – the new generation of combustion equipment management

The future of combustion control is modular. Honeywell's new SLATE system not only seamlessly updates and replaces RM7800 Flame Safeguard Controls, but also provides combustion control and safety benefits far beyond what FSG devices can traditionally provide. The SLATE toolkit includes a base and burner control module along with optional modules for fuel-air ratio control, annunciation, digital or analog i/o, and more. Sound complex? SLATE makes upgrading a snap with flexible programming tools and custom application kits. Plus, with additional features such as an easy-to-read display, and BACnet or Modbus communications, SLATE will integrate with your existing systems to improve your operator experience and increase efficiencies.
