

TEMPERATURE UNIFORMITY SURVEY CASE

The Honeywell Multitrend paperless recorder, which is utilized in the GTH TUS case, features a 12.1 inch diagonal high-resolution display, with a capability of recording up to 40 analog inputs. All acquired data being uploaded from the recorder to the Honeywell TrendServer Pro software via a flash drive or Ethernet connection for easy viewing and the distribution of information. The recorder, working in step with the AMS2750 Report Generating Tool, will grant the ability to create temperature uniformity survey reports that are informative and easy to read and access.

This is the same recording device used by George T. Hall Company Technicians when performing Temperature Uniformity Survey tests at our valued customer's facilities. The generated report can be customized with company name, furnace specifications, and process information, providing extensive survey feedback and a professional look to each report.
