

Looking for secure remote access to your industrial systems?

Operating and monitoring various instruments and equipment across large facilities or geographic areas is often a difficult but necessary task. The use of Remote Terminal Units (RTU) can bring all your information into one convenient location. Along with the convenience of a centralized information hub comes other obstacles such as remote Virtual Private Network (VPN) and Cyber Security. With the right robust industrial equipment, you can have a system that can provide you with both data and control with the confidence of a secure network..

Phoenix Contact

Phoenix Contact's mGuard Secure Cloud offers operators a highly secure, web-based method for instant remote services to any machine and production plant within the client's network. The mGuard is a professionally hosted, turnkey remote-services ecosystem for the plant operator. Service personnel can connect to the Secure Cloud website through a standard web browser to access all relevant system information including locations, operators, machines, and access rights.

Honeywell

Honeywell ControlEdge RTU

The Honeywell ControlEdge RTU is a powerful and modular controller capable of all remote automation and control applications. The Honeywell RTU works with Honeywell's SCADA products, providing an integrated solution to solve complex remote automation requirements for distributed equipment. When utilized with Experion SCADA, users can visualize what they need to know to simplify management of field assets and reduce configuration time by 80%!
